Free STEM Labs as they relate to solving Crime Scenes

National CSI Camp has put together a robust collection of video labs and educational materials that the students can use to learn the basics of forensic science from home!

Students will learn various skills like interviewing a suspect, conducting a contact trace interviews, lifting fingerprints, creating a magnifying glass, casting a footprint and much more! Some of the labs may even help your residents of boy/girl scout troops qualify for one of their badges (double check with their scout leader first). The content is geared towards children who are 9-17 years old and utilizes materials you can find around your home. Please 'like & follow' National CSI Camp on Facebook for more great programs and be sure to keep an eye out for our future program locations. Click here to view the labs and materials:
